### PROBLEM STATEMENT-

CONSTRUCT A CONTEXT FREE GRAMMAR TO MATCH THE SYNTAX OF FOR LOOP IN JAVASCRIPT

### SYNTAX OF FOR LOOP-

for(initialisation;condition;updatation)

### CONTEXT FREE GRAMMAR-

CFG of for loop

$S \rightarrow XY$   
 $X \rightarrow \text{'for'}$   
 $Y \rightarrow (\text{init} ; \text{cond} ; \text{updatation})$   
 $\text{init} \rightarrow \text{var} \mid \text{var} = \text{num}$   
 $\text{cond} \rightarrow \text{expr} \parallel \text{expr} \mid \text{expr} \&\&\text{expr} \mid !\text{expr}$   
 $\text{expr} \rightarrow \text{var} > \text{num} \mid \text{var} \geq \text{num} \mid \text{var} == \text{num} \mid \text{var} < \text{num} \mid$   
 $\text{var} <= \text{num} \mid \text{var} != \text{num} \mid \text{var} === \text{num} \mid \text{var} !== \text{num}$   
 $\text{updatation} \rightarrow \text{var} + = \text{num} \mid \text{var} - = \text{num} \mid \text{var} * = \text{num} \mid \text{var} / = \text{num} \mid \text{var} ** = \text{num}$   
 $\text{num} \rightarrow \text{sign magnitude}$   
 $\text{sign} \rightarrow + \mid - \mid \lambda$   
 $\text{magnitude} \rightarrow \text{magnitude} \mid \text{magnitude magnitude} \mid 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9$   
 $\text{var} \rightarrow \text{any acceptable identifier name}$

## PROGRAM TO MATCH THE SYNTAX OF FOR LOOP IN C

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

//array to copy first three characters of string str
char arr[3];

void isCorrect(char *str)
{
    //semicolon, bracket1, bracket2 are used
    //to count frequencies of
    //';', '(', and ')' respectively
    //flag is set to 1 when an error is found, else no error
    int semicolon = 0, bracket1 = 0, bracket2 = 0, flag = 0;

    int i;
    for (i = 0; i < 3; i++)
        arr[i] = str[i];

    //first 3 characters of the for loop statement is copied
    if(strcmp(arr, "for") != 0)
    {
        printf("Error in for keyword usage");
        return;
    }

    //Proper usage of "for" keyword checked
    while(i != strlen(str))
    {
        char ch = str[i++];
        if(ch == '(')
        {
            //opening parenthesis count
            bracket1 ++;
        }
        else if(ch == ')')
        {
            //closing parenthesis count
            bracket2 ++;
        }
    }
}
```

```

    }
    else if(ch == ';')
    {
        //semicolon count
        semicolon++;
    }
    else continue;

}

//check number of semicolons
if(semicolon != 2)
{
    printf("\nSemicolon Error");
    flag++;
}

//check closing Parenthesis
else if(str[strlen(str) - 1] != ')')
{
    printf("\nClosing parenthesis absent at end");
    flag++;
}

//check opening parenthesis
else if(str[3] == ' ' && str[4] != '(' )
{
    printf("\nOpening parenthesis absent after for keyword");
    flag++;
}

//check parentheses count
else if(bracket1 != 1 || bracket2 != 1 || bracket1 != bracket2)
{
    printf("\nParentheses Count Error");
    flag++;
}

//no error
if(flag == 0)
    printf("\nNo error");
}

int main(void) {

```

```
char str1[100] = "for (i = 10; i < 20; i++)";  
isCorrect(str1);  
  
char str2[100] = "for i = 10; i < 20; i++)";  
isCorrect(str2);  
  
return 0;  
}
```

## OUTPUT SCREENSHOT

```
No error  
Opening parenthesis absent after for keyword
```
